

The PhD thesis of István Sabjanics

With regard to the aims stated at the beginning of the thesis, major results of the research can be summarised as follows:

- 1) Different methods of data acquisition, such as the research of specialised literature, the interviews and also the questionnaire, proved unanimously that as a result of the transformation of general safety and security, appearance and spreading of private security services have been inevitable in Hungary.
- 2) The syllabus of the independent subject, Security management, has been worked out with view to the changes in society and particular necessity for safety, and also on the basis of the ECTS (European Credit Transfer System).
- 3) It has been proved in the course of the research that the competency model which is able to describe the field profile objectively and present it levelled, can be worked out and be used in elementary, secondary and tertiary levels of education at defining syllabus elements. Competency profile shows the knowledge, experience, skills and characteristics necessary for certain scope of activity in connection with personal security. It has also been proved, that since the mentioned competency elements are levelled, the level of education or professional training needed for the set of profiles specified for the given scope of activity, can be easily determined in the recommended model. As a conclusion, it is necessary to form a competency based educational system adequate for the field profile.
- 4) Competency model intended for body guard profession, has also been worked out.
